#### **Revised Labour Force Survey Estimates:** January 1989 to January 1994

#### Introduction

Labour force survey estimates for the period January 1989 to January 1994 have been revised. The revisions take into account amended population estimates based on the results of the 1991 Census of Population and Housing.

Revised estimates for principal labour force survey series were first presented in the February 1994 issue of The Labour Force Australia. Preliminary (6202.0). The Appendix to the February 199 issue of The Labour Force, Australia, (6203.0) also contained revised estimates for the period from January 1989 onwards.

The revisions were necessary to ensure that comparisons of labour force survey estimates from February 1994 (based on 1991 Census population totals) with estimates for the period January 1989 to January 1994 (previously based on 1986 Census population totals) can be made on a sound basis. Such comparisons would otherwise be distorted by an unquantified effect due solely to a change in estimates of the population.

An examination of the revised estimates between June 1986 and June 1991 showed that the effects on labour force survey estimates for the period before January 1989 were inconsequential, and that no meaningful purpose would be served by publishing revised estimates for that period.

This paper examines the impact of the revised population totals on some of the main estimates produced from the survey.

**Population benchmarks** Labour Force Survey estimates of persons employed, unemployed and not in the labour force are calculated in such a way as to add to independently estimated counts (benchmarks) of the usually-resident civilian population aged 15 and over. The benchmarks are based on Census of Population and Housing data, adjusted for underenumeration and updated monthly for births, deaths, interstate migration and net permanent and long-term migration. Benchmarks are classified by State/Territory of usual residence, part of State of usual residence (metropolitan non-metropolitan), age and sex, which are known as benchmark cells.

> Expansion factors or weights are applied to the sample responses to derive estimates that relate to the whole population in the scope of the survey. In essence, weights are calculated each month by dividing the population in each benchmark cell by the number of persons in the corresponding sample cell (with adjustments for persons enumerated away from their State of usual residence). Each sample respondent is then given a weight corresponding to the State/Territory of usual residence, part of State of usual residence, age and sex cell.

> Estimates of the total number of persons in the population with a certain characteristic are formed by summing the weights of the persons in the sample with that characteristic. The weighting procedure reduces sampling variability by ensuring that estimates conform to the benchmark

distribution of the population by age, sex and geographic area while at the same time automatically compensating and adjusting for any underenumeration or non-response in the survey.

#### Revision of estimates

Survey estimates are not revised for the usually small amendments of population benchmarks arising from new data on deaths and overseas and internal migration. Revisions are made, however, after each Census of Population and Housing, and when population estimation bases are reviewed. These revisions affect original, seasonally adjusted and trend stimates. The last such revision was made in February 1989 to take account of the results of the 1986 Census of Population and Housing, which affected all the monthly estimates from January 1984 to January 1989.

#### Changes in population benchmarks

The post-1991 Census revision generally resulted in downward adjustments to population estimates. The male population was revised downwards by 10,000 in January 1989 and by 63,900 in January 1994 whereas the female population increased by 7,300 in January 1989, falling by 36,100 in January 1994.

estimates

Changes in employment Estimates of employed males were reduced by 7,200 in January 1989 and by 50,300 in January 1994. In contrast, estimates of employed females increased by 6,400 in January 1989 but decreased by 12,600 in January 1994.

DIAGRAM 2: CHANGE IN EMPLOYMENT LEVELS

Changes in unemployment estimates

Changes in male unemployment levels fluctuated from -600 in January 1989 to -7,300 in May 1993 and -6,900 in January 1994. Female unemployment estimates were adjusted upwards by 300 in January 1989. The largest difference for females was -2,700 in March and July 1993, dropping to -1,000 by January 1994.

**DIAGRAM 3: CHANGE IN UNEMPLOYMENT LEVELS** 

Percentage change in labour force categories

Diagrams 4 and 5 illustrate the relationship between the percentage change in the labour force categories of the civilian population. In percentage terms, the reduction in male benchmarks is reflected more in the employment and unemployment categories rather than in the not in the labour force category. In comparison, the downward revision to female benchmarks resulted in downward revisions that were marginally largest in the not in the labour force category.
